"Activity of Cysteine-desulphhydrase and of Rhodanase in Human Tissues."

Warsaw-Krakow, Przegląd Lekarski, Vol 19, Ser II, No 2, 28 Feb 63, pp 141-143.

Abstract: [Authors' English summary modified] Investigations disclosed that the activity of the two enzymes connected with sulphur transformation is parallel and is highest in the liver, kidneys, gastric mucosa, muscles, salivary glands, and pancreas. Authors discuss the importance of hydrogen sulphide generation in the tissues in reference to the mechanism in which sulfurhemoglobinemia originates. Of the 14 cited references, 4 are Polish and the others Western.

gastrektomii a jejich prevence výživou - Kojcký Z. and Bittmann
O. II. Int. Prop. Klin., Olomouc - ČSL. GASTROENT. VÝŽ. 1958, 12/3-4
(243-251) Graphs 2

200 patients were studied after total gastrectomy with oesophagojejunal anastom-
osis or replacement of the stomach by a jejunal loop interposed between the oeso-
phagus and the duodenum. Forty-five of the patients have survived for more than
5 yr.; one patient is still alive after 10 yr. and 4 months. Though X-ray examin-
ations indicate profound changes of the intestinal motor activity the barium meal
does not pass so rapidly through the small intestine as to indicate a grossly im-
paired intestinal absorption. Nor can disturbances of the intestinal digestion be
explained by changes of the pancreatic or intestinal secretion (Budagovskaja).
Balance studies show that the digestive system is able to compensate the loss of
the stomach. It is, however, difficult to compensate the loss of the stomach for
the organism as a whole. Experience with vit. B₁₂ therapy provides evidence that
the stomach plays a role in the regulation of haemopoiesis and proves that nutri-
tional deficiencies are caused rather by interference into the metabolism than by
interference with the digestive system. Vit. B₁₂ is one of the so far known sub-
stances which are used to compensate the metabolic consequences of total gastrec-
tomy.

Title : Studies of Preparation of Stable Vitamin B₁₂ Injections.

Orig Pub : Acta polon. pharm., 1957, 15, No 5, 359 - 369.

Abstract : At the preparation of injection preparations (IP) of vitamin B₁₂ (cyanocobalamin), the isotonic (with the addition of 0.8% of NaCl) aqueous solution of 0.02 M NaH₂PO₄ (pH about 4.6) is used as solvent. No bactericides (phenol) are added to the injection fluid; the ampules are sterilized 0.5 hour at 100°. The preparation of IP and the packing of ampules is carried out under conditions excluding the action of light on the vitamin B₁₂. The vitamin B₁₂ content in IP is checked by spectrophotometrical measurement of absorption at 361 mμ.

"Fluctuations in Serum Protein Composition and Serum Antibody Level of Pigs Hyperimmunized with Aujeszky's Disease Virus"

Budapest, Acta Veterinaria Academiae Scientiarum Hungaricae, Vol 16, No 2, 27 Jun 1966, pp 159-166.

Abstract: [English article] The specific virus-neutralizing antibody titers and changes in the composition of serum protein were followed in pigs hyperimmunized with the Phylaxia strain of Aujeszky's disease virus for a 16-week period. The albumin/globulin ratio decreased permanently in the blood serum and there was a temporary increase in the alpha-2 fraction in all cases. In some cases there was also a temporary increase in beta globulin and gamma globulin. The serum level increased significantly by the 2nd day following hyperimmunization and reached a maximum after 7 days. Apparently, the synthesis of the antibody was not associated with an increase in any particular serum protein fraction. 6 references, including 1 German, 1 Western, and 4 Hungarian. Title : Use of Antiserum for Protecting Suckling Piglets
Against Aueski Disease on Infected Farms.

Orig Pub: Magyar allatorv. lapja, 1957, 12, No 4-5, 102-104.

Abstract: Adult pigs, immune to Aueski disease (AD) and to
swine pest were hyperimmunized with the AD virus.
The hyper-immunized serum was administered to 943
suckling piglets in the age group of 2-6 weeks;
752 piglets were used as control animals. Sixty-
three (6.7 percent) of the inoculated piglets died
from AD, and 229 (20.4 percent) of the control animals
perished.

AUTHOR: Kok, I.P.

TITLE: Nuoleotide Composition of Highly Polymerized
Desoxyribonucleic Acid of Some Insects

PERIODICAL: Dopovidi Akademii nauk Ukrain's'koi RSR, 1959, Nr 5,
pp 502-504 (USSR)

ABSTRACT: Having taken into account the failure of obtaining high-polymer DNA from chrysales of silkworm by conventional methods described in references 1-4, the author tried another approach, described by J.M. Gulland [Ref. 5] and has been successful. He experimented on local silkworm, Chinese oak silkworm, common flies and on mice. The results are shown in a table on page 503. In this article, the author describes how he accomplished that (method of separation of DNA), how he analyzed the results (by the method of J. Webb, H. Levy [Ref. 6] and according to Eiler and Khan [Ref. 7], by the method of A.G. Cornall [Ref. 8] and by the

Card 1/2

Nucleotide Composition of Highly Polymerized Desoxyribonucleic Acid of Some Insects

chromatographic method described in Ref. 9. The amount of nitric base was determined by the method described in Ref. 10, after a study with a spectrophotometer SF-4). Altogether, the author separated 9 preparations of DNA. The content of DNA in a dry preparation obtained from oak silkworm was 48%, in that of local silkworm 56%, in those from mice 63-64%. DNA molecular weight was 1.0×10^6 . All the DNAs studied by the author belonged to the AT type. There is 1 table and 12 references, 4 of which are Soviet, 6 English and 2 Swiss.

AUTHOR: Kok, I. P.

TITLE: The Attempt to Obtain Genetic Transformation in Mice by Means of DNA (Desoxyribonucleinic acid)

PERIODICAL: Dopovidi Akademii nauk Ukrain's'koi RSR, 1959, Nr 8, pp 921 - 922 (USSR)

ABSTRACT: The article covers a thorough description of an experiment on the genetic transformation in mice by means of DNA preparations. The highly polymerized DNA was extracted from mice of a C₃HA inbred stock which is peculiar for its predominant color factors (AA BB CC DD PP). A limpid solution of this compound was injected 2 - 3 times a day into sucklings during the first week of their postnatal life. All sucklings were of the "pink" inbred stock carrying recessive color factors (AA BB CC DD PP). A total of 39 mice were subjected to such experiments which did not give positive results. They did not differ from mice without such injection either by the color of fur or by the color of iris. Not even

The Attempt to Obtain Genetic Transformation in Mice by Means of DNA
(Desoxyribonucleic acid)

single hairs or small spots on the iris which would have shown the dominant properties of the DNA donators, were noted. The negative results of these experiments, however, are interesting in the aspect of the experimental data about the transformation of leucemia in mice not by means of DNA, but by nucleoproteide [Ref. 4] The article also presents a chemical characteristic of the DNA preparations as well as their nucleotide composition, which is shown in a table. There is 1 table, and 4 references, 2 of which are Soviet, 1 French and 1 Czechoslovakian

Abstract : In 68 cases of progressive muscular dystrophy there
was a contraction of the unchanged and hypertrophic
muscles and a persistent elongation of chronaxia
(or absence of galvanic stimulation) on the atrophic
muscles. In a number of cases when there was no
tendon reflex, there was a heterochronia of the nerve
and muscle; in 5 cases restoration of isochronia
